

Albert Muratbaev

Full-stack and Mobile Developer

maratbekniyazov@gmail.com | github.com/maratbekniyazov | linkedin.com/in/albert-muratbaev-a39ba4373 | t.me/albertmra

PROFESSIONAL SUMMARY

Full-stack developer focused on Python backends, cross-platform mobile applications, and React web interfaces. Built two end-to-end production-like projects covering REST APIs, authentication, resource-level authorization, PostgreSQL/PostGIS, realtime GPS tracking, maps, object storage, background processing, automated tests, and Docker environments. Strong at API contracts, domain modeling, resilient client behavior, security, and root-cause debugging.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, Dart, SQL, HTML, CSS, Bash, PowerShell

Backend: Django, Django REST Framework, FastAPI, Pydantic, SQLAlchemy Async, Alembic, SimpleJWT, REST, OpenAPI, WebSocket, Celery

Mobile and web: React Native, Expo, Expo Router, Flutter, BLoC, Clean Architecture, React, Vite, TanStack Query, Zustand, React Hook Form, Zod

Data and infrastructure: PostgreSQL, PostGIS, GeoDjango, Redis, Pub/Sub, MinIO/S3, Docker, Docker Compose, Git/GitHub, CI/CD, Android SDK/NDK

Testing and quality: pytest, pytest-django, pytest-asyncio, Vitest, Flutter unit/widget/integration tests, Ruff, mypy, ESLint, Prettier, TypeScript strict mode

SELECTED PROJECTS

Real Estate Marketplace MVP | Full-stack Developer

Django REST Framework, React Native, Expo, PostgreSQL, PostGIS, Redis, Celery, MinIO, Docker

- Restored an unfinished backend and mobile application and aligned both clients around a versioned **/api/v1** REST contract.
- Implemented phone/OTP and password authentication, JWT access/refresh rotation and blacklist, secure token storage, logout, and single-flight refresh behavior.
- Designed Building, Unit, Property, Listing, Favorite, Inquiry, and Media models with constraints, indexes, state transitions, and service-level authorization; prevented IDOR/BOLA through owner-scoped queries and negative tests.
- Built PostGIS bounding-box and radius search, distance ordering, GiST indexes, validation, and query-plan checks against a real database.
- Created a presigned S3/MinIO media flow and delivered mobile discovery, filters, server-driven pagination, favorites, inquiries, RU/UZ/EN localization, and complete loading/error/retry states.
- Verified Docker services and an Android API 36 x86_64 debug build against the local API; reached **153 passing backend tests and 11 mobile unit tests**.

Last-Mile Delivery Platform | Full-stack / Mobile Developer

Flutter, BLoC, FastAPI, React, TypeScript, PostgreSQL, PostGIS, Redis, WebSocket, Docker

- Built a monorepo with Flutter applications for customers and couriers, a React/TypeScript dispatcher dashboard, and an asynchronous FastAPI backend.
- Implemented authentication, token refresh, secure storage, role-aware routing, and server-owned identity for client, courier, dispatcher, and admin; modeled order lifecycle with row locking, transition checks, assignment, and audit events.
- Developed authorized WebSocket GPS tracking with coordinate validation, five-second or ten-meter throttling, bounded reconnect, and correct shutdown on logout.
- Used Redis for current positions and Pub/Sub across backend processes; implemented maps, PostGIS search, infinite scrolling, page deduplication, and stable mobile states.
- Integrated server-side route and ETA calculation behind a provider adapter with timeout, strict response validation, encoded-polyline handling, and deterministic fallback.
- Added backend, Flutter, and dashboard tests, static analysis, Docker Compose services, environment validation, and CI/CD checks.

ENGINEERING STRENGTHS

- **Security and reliability:** JWT, RBAC, resource-level authorization, IDOR/BOLA prevention, state machines, database constraints, row locking, bounded retries, and regression tests.
- **Architecture:** service and selector layers, Clean Architecture, repository patterns, provider adapters, server-owned contracts, and modular monolith design.

Project scope: Both systems are educational, production-like projects validated locally through Docker, emulators, builds, and automated tests. They are not represented as live commercial services with production traffic or real users.
